

Within-genotype/cultivar temporal AED: own study (0hpi baseline) vs Shi2024 (T0/DEV01 baseline)
 0hpi treated as occupying Shi2024's T1 ordinal slot (both = first post-baseline measurement), per instruction.
 ALL tests in both datasets are at their permutation floor -- p-values carry no discriminating power here,
 read AggrDiv magnitude/slope only, and note the two designs measure different things
 (own study = induced infection response; Shi2024 = constitutive/developmental, no pathogen challenge).

AggrDiv (mean squared log2 divergence, own within-genotype/cultivar null)

(own study: 1=6hpi, 2=24hpi | Shi2024: 1=T1/DEV02 ... up to T6/DEV11 -- NOT the same physical time unit, see script head)
